

How CSS can help:

Security Software Portfolio

CSS builds software tools that extend the enterprise platform.

Certificate Reporting Tool (CRT)

The Certificate Reporting Tool (CRT) is a unique solution designed to alert your tech team in a timely fashion of impending expiration of certificates and CRLs. CRT eliminates the need for spreadsheets and other manual certificate and CRL tracking methods, and keeps track of any certificates, including SSL, device and other non-identity certificates. With IT departments stretched thinner than ever, CRT helps make sure nothing falls through the cracks.

Federation Services Toolset (FST)

The Federation Services Toolset (FST) adds an additional protocol capability to Active Directory Federation Services (ADFS) that allows an organization to use its ADFS infrastructure with more partners.

Virtual Internet Explorer

CSS provides full support for virtualizing Internet Explorer leveraging Microsoft Application Virtualization (App-V) technology. This enable web applications that rely on Internet Explorer 6 and Internet Explorer 7 to run on any windows platform including Windows 7 without any changes to the local OS.

Forefront Advanced System Tools (FAST)

Forefront Advanced System Tools – or FAST – from CSS is designed to help drive Identity Management projects significantly faster and more affordably than previously possible. FAST contains a variety of utilities, software components, and custom FIM Management Agents to make Microsoft's Forefront Identity Manager deployments more robust.

Distributed Authorization Reporting Tool (DART)

To help organizations track user access enterprise-wide, as well as, minimize your audit and regulatory compliance challenges, CSS developed the Distributed Authorization Reporting Tool (DART). DART extends an organization's security view and provides critical data to better protect it from security risks. Integrating DART allows organizations an opportunity to inventory file shares centrally and generate reports based on data collected from Active Directory (AD) and member servers.

CASPER

Created specifically for the Department of Defense, CASPER allows new users to that Active Directory (AD) to securely request access by leveraging a trusted authentication source to authenticate the user and automatically initiate the provisioning process within the identity management system.

Licensing Program

CSS offers flexible licensing options in efforts to find a licensing vehicle that best fits your organization's size and needs.

CSS is committed to providing the very best in technical support to licensed users of our software products, ensuring the reliability of our products and maximum utilization of our tools.

- Connect directly to security experts at CSS
- Phone, e-mail support responses within one business day
- Free software updates, upgrades and new version releases

An annual support contract begins on the date that the software license is purchased, or on the date that the previous year's contract expires, and is active for 12 continuous months.

CSS can provide additional support during implementation, custom report development and configuring additional member/local servers. Support is purchased at a daily rate.

About

CSS is an information security services firm to the world's leading corporations, serving a majority of the Global 2000. We help clients reduce risk and protect information assets by leveraging existing and emerging technologies to deliver innovative solutions that provide long-lasting business value. We specialize in identity & access, infrastructure security, cloud services, and security strategy & governance. Our clients can choose from one of our four service delivery models: consulting, managed services, SaaS and security software tools. For more information and a complete list of branch offices, visit www.css-security.com, call 877.715.5448, or e-mail sales@css-security.com.
